ABSTRACT

This erratum relates to our work “Fundamental groups of some special quadric arrangements”. The original Theorems 2.2, 2.5, 2.8 and Propositions 2.3(ii)(iii), 2.6(ii)(iii), 2.9(ii)(iii) have wrong results. They need to be rephrased. Corollaries 2.4 and 2.7 are incomplete, and they are extended. We add a new Corollary 2.10, which does not appear in the original paper. Proposition 3.1 has a wrong result and it is rephrased and reproved.

In Proposition 4.1 and its Corollary 4.2 a slight error has occurred: as the correct proofs in the paper show, the monodromy is a quadruple fulltwist.

Key words: Fundamental groups, complement of curve, quadric arrangement.

2000 Mathematics Subject Classification: 14H20, 14H30, 14Q05.

1. Wrong results

Theorems 2.2, 2.5, 2.8 and Propositions 2.3(ii)(iii), 2.6(ii)(iii), 2.9(ii)(iii) are wrong. We prove here new results 2.2, 2.5, 2.8, explaining the wrong results in the original version. Since Proposition 2.3(ii)(iii) presents the specific cases \( n = 2, 3 \) for the general \( n \) in Theorem 2.2, it can be combined with the New Theorem 2.2. In the same manner,
we combine also Proposition 2.6(ii)(iii) with the New Theorem 2.5, and Proposition 2.9(ii)(iii) with the New Theorem 2.8.

Figures 2, 3, 4 (pages 264-266 in the paper) of the arrangements from Theorems 2.2, 2.5, 2.8 are replaced by Figures 1, 6, 9 respectively.

Figure 1 replaces Figure 2 from page 264 in the paper.

Figure 1 – The arrangement $\mathcal{A}_n$.

Theorem 2.2 and Proposition 2.3 (page 263-264 in the paper) are rephrased as one general statement as follows:

**New Theorem 2.2.** The fundamental group $\pi_1(\mathbb{P}^2 \setminus \mathcal{A}_n)$ of $\mathcal{A}_n$ in $\mathbb{P}^2$ admits the presentation

$$\pi_1(\mathbb{P}^2 \setminus \mathcal{A}_n) \simeq \langle a_1, a_2, \ldots, a_n \mid (a_1 a_2 \cdots a_n)^2 = e \rangle,$$

where $a_1, \ldots, a_n$ are meridians of $Q_1, \ldots, Q_n$, respectively.

**Proof of New Theorem 2.2.** In order to find the fundamental group $\pi_1(\mathbb{P}^2 \setminus \mathcal{A}_n)$, we need the algorithm of Moishezon-Teicher for global braid monodromy. Let us consider the following setting (Figure 2). $S$ is an algebraic curve in $\mathbb{C}^2$, with $p = \deg(S)$. Let $\pi : \mathbb{C}^2 \to \mathbb{C}$ be a generic projection on the first coordinate. Define the fiber $K(x) = \{y \mid (x, y) \in S\}$ in $S$ over a fixed point $x$, projected to the $y$-axis. Define $N = \{x \mid \#K(x) < p\}$ and $M' = \{s \in S \mid \pi_s \text{ is not étale at } s\}$; note that $\pi(M') = N$. Let $\{A_j\}_{j=1}^q$ be the set of points of $M'$ and $N = \{x_j\}_{j=1}^q$ their projection on the $x$-axis. Recall that $\pi$ is generic, so we assume that $\#(\pi^{-1}(x) \cap M') = 1$ for every $x \in N$. Let $E$ (resp. $D$) be a closed disk on the $x$-axis (resp. the $y$-axis), such that $M' \subset E \times D$ and $N \subset \text{Int}(E)$. We choose $u \in \partial E$ a real point far enough from the set $N$, $x << u$ for every $x \in N$. Define $\mathbb{C}_u = \pi^{-1}(u)$ and number the points of $K = \mathbb{C}_u \cap S$ as $\{y_1, \ldots, y_p\}$.

We construct a g-base for the fundamental group $\pi_1(E - N, u)$. Take a set of paths $\{\gamma_j\}_{j=1}^q$ which connect $u$ with the points $\{x_j\}_{j=1}^q$ of $N$. Now encircle each $x_j$ with a small oriented counterclockwise circle $c_j$. Denote the path segment from $u$
to the boundary of this circle as $\gamma_j'$. We define an element (a loop) in the g-base as $\delta_j = \gamma_j' c_j \gamma_j'^{-1}$. Let $B_p[D, K]$ be the braid group, and let $H_1, \ldots, H_{p-1}$ be its frame (for complete definitions, see [3, Section III.2]). The braid monodromy of $S[1]$ is a map $\varphi: \pi_1(E - N, u) \to B_p[D, K]$ defined as follows: every loop in $E - N$ starting at $u$ has liftings to a system of $p$ paths in $(E - N) \times D$ starting at each point of $K = \{y_1, \ldots, y_p\}$. Projecting them to $D$ we get $p$ paths in $D$ defining a motion \{ $y_1(t), \ldots, y_p(t)$ \} (for $0 \leq t \leq 1$) of $p$ points in $D$ starting and ending at $K$. This motion defines a braid in $B_p[D, K]$. By the Artin Theorem [4], for $j = 1, \ldots, q$, there exists a halftwist $Z_j \in B_p[D, K]$ and $\epsilon_j \in \mathbb{Z}$, such that $\varphi(\delta_j) = Z_j^{\epsilon_j}$ ($\epsilon_j = 1, 2$ or 4 for an ordinary branch point, a node, or a tacnode respectively). We explain now how to get this $Z_j$.

Let $A_j$ be a singular point in $S$ and its projection by $\pi$ to the x-axis is $x_j$. We choose a point $x_j'$ next to $x_j$, such that $\pi^{-1}(x_j')$ is a typical fiber, which intersects the two components which meet at $A_j$ in two points, say $a, b$. We fix a skeleton $\xi_{x_j'}$ which connects $a$ and $b$, and denote it as $<a, b>$ (in a case that more than two components meet at $A_j$, we consider $a, b$ to be the two extreme components). The Lefschetz diffeomorphism $\Psi$ (see [3]) allows us to get a resulting skeleton $(\xi_{x_j'})\Psi$ in the typical fiber $C_u$. This one defines a motion of its two endpoints. This motion induces a halftwist $Z_j = \Delta <(\xi_{x_j'})\Psi >$. As above, $\varphi(\delta_j) = \Delta <(\xi_{x_j'})\Psi >^{\epsilon_j}$. The braid monodromy factorization associated to $S$ is

$$\Delta_p^2 = \prod_{j=1}^{q} \varphi(\delta_j).$$

Before proving the theorem, we have to study the local monodromy around a common tacnode (of $n$ quadrics) and the relation which is derived from this monodromy. We do it in the following propositions:

(i) The following proposition replaces Proposition 3.1 (page 267 in the paper).

Proposition 3.1 is wrong and therefore it is rephrased and proved as follows.
New Proposition 3.1. Let $O$ be a singular point defined locally by \((y-x^2)(y-2x^2)\cdots(y-nx^2)\). Then the local monodromy around $O$ is a double fulltwist on the disk (Figure 3 replaces Figure 5 from the paper, page 267).

\begin{figure}[h]
\centering
\includegraphics[width=0.5\textwidth]{figure3}
\caption{The point $O$.}
\end{figure}

Proof. Take a loop $x = e^{2\pi i t}$ in $y = 0$, starting (and ending) at some base point and encircling the point $O$, $0 \leq t \leq 1$. Let $a_1, a_2, \ldots, a_n$ be the points of the curve in a typical fiber next to the fiber $F_O$.

When $t$ is running from 0 to $1/2$, the point $a_1$ is rotating around the other points in a fulltwist $e^{2\pi i t}$, the point $a_2$ is rotating along a closed curve which bounds a disk, containing the trajectory of the point $a_1$, and so on. When $t$ is running from $1/2$ to 1, we have the same motion. This gives us the needed double fulltwist.

(ii) The following proposition replaces the beginning of the proof of Theorem 2.2 (page 267 in the paper).

Proposition. If a point $O$ is one among two tacnodes between $n$ quadrics (see Figure 1), then we have the relation
\[(a_n \cdots a_2a_1)^2 = (a_1a_n \cdots a_2)^2 = \ldots = (a_{n-1}a_{n-2} \cdots a_1a_n)^2,
\]
and if $O$ is a unique tacnode between $n$ quadrics (see Figures 6 and 9), then we have the relation
\[(a_n \cdots a_2a_1)^4 = (a_1a_n \cdots a_2)^4 = \ldots = (a_{n-1}a_{n-2} \cdots a_1a_n)^4.
\]

The first part of the proposition is proved in the paper (pages 267-268). The second part is concluded easily from the first part and also from New Proposition 4.1 (see Section 2).
We are interested in the group $\pi_1(\mathbb{P}^2\setminus \mathcal{A}_n)$. We start with $\mathcal{A}_1$ (a smooth quadric), and it is easy to see that the group $\pi_1(\mathbb{P}^2\setminus \mathcal{A}_1)$ is $\mathbb{Z}_2$ (which is abelian).

The cases $n = 2, 3$ have wrong results in the paper (see Proposition 2.3(ii)(iii) in the paper). We prove new results here and conclude the general case $\pi_1(\mathbb{P}^2\setminus \mathcal{A}_n)$.

Let us consider the arrangement $\mathcal{A}_2$, see Figure 4 (replaces Figure 7 from the paper, page 269). We want to compute the braid monodromy factorization of $\mathcal{A}_2$. Consider the above general setting (see Figure 2). By abuse of notation we denote the points $y_1, y_2, y_3, y_4$ of $K$ as 1, 2, 3, 4 respectively (see the typical fiber in Figure 4). For simplicity, we denote also the singular points as $j$ instead of $A_j$ (see the dotted points in Figure 4). Let $\{j\}_{j=1}^3$ be singular points of $\pi_1$ on the left side of a chosen typical fiber as follows: 1 is a tacnode (among two tacnodes in the arrangement), 2 and 3 are branch points of the quadrics.

We are looking for $\varphi(\delta_j)$ for $j = 1, 2, 3$. So we choose a $g$-base $\{\delta_j\}_{j=1}^3$ of $\pi_1(E - N, u)$, such that each $\delta_j$ is constructed from a path $\gamma_j$ below the real line and a counterclockwise small circle around the points in $N$.

The diffeomorphisms which are induced from passing through branch points (such as $\Delta_{\hat{t}_k}^+ < k >$ and $\Delta_{\hat{t}_k}^- < k >$) were defined in [4]. We recall the definition from [4]. Consider two typical fibers on the left and right sides of a branch point (locally defined by $y^2 - x = 0$). The typical fiber on the left side intersects the quadric in two complex points. Now, if we pass through this point to the right typical fiber (see Lefschetz diffeomorphism [3]), the two complex points move to the k'th place and rotate in a counterclockwise 90° twist into the real axis and are numbered as $k, k + 1$ (in the right typical fiber).

In order to construct the braid monodromy table, we find first the skeletons $\xi_{x_j}$ related to the singular points (following Figure 4). Then we compute the local diffeomorphisms $\delta_j$ induced from the singular points. We fix them in the braid monodromy table below:
By Moishezon-Teicher algorithm [4], we compute the skeleton $(\xi_{x_j'})^\gamma_{\delta_j}$ on the typical fiber for each $j$, by applying to the skeleton $\xi_{x_j'}$ the product $\prod_{i=j-1}^1 \delta_i$. The resulting braids are as follows.

A braid related to the tacnode:

$$(\xi_{x_1'})^\gamma_{\delta_1} = <1,2> = z_{12},$$
$$\varphi(\delta_1) = Z_{12}^4,$$

A braid related to the inner branch point:

$$(\xi_{x_2'})^\gamma_{\delta_2} = <2,3> \Delta^2 <1,2> = z_{23}^{Z_2},$$
$$\varphi(\delta_2) = Z_{23} Z_{21}^2 z,$$

A braid related to the outer branch point:

$$(\xi_{x_3'})^\gamma_{\delta_3} = <1,2> \Delta_{t+t_2}^\frac{3}{2} <2> \Delta^2 <1,2> = z_{14} 4,$$
$$\varphi(\delta_3) = \bar{Z}_{14}.$$
typical fiber (see Figure 4), we apply the diffeomorphisms clockwise on the skeleton, namely \( \prod_{i=j}^{i=1} \delta_i^{-1} \). The resulting braids in this case are the complex conjugates of the ones which are derived as if we apply the diffeomorphisms counterclockwise (as we do for the left side), see works which use complex conjugates of braids, e.g. [2]. Since we are able to get the same relations for the fundamental group by simplifying the complex conjugates relations, we prefer the braids which are derived by applying counterclockwise diffeomorphisms. We remind that there are three singular points on the right side of the chosen typical fiber: 1 is a tacnode, 2 and 3 are branch points of the quadrics. The related monodromy table is:

<table>
<thead>
<tr>
<th>( j )</th>
<th>( \xi_{x_j} )</th>
<th>( \epsilon_j )</th>
<th>( \delta_j )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>( &lt; 3, 4 &gt; )</td>
<td>4</td>
<td>( \Delta^2 &lt; 3, 4 &gt; )</td>
</tr>
<tr>
<td>2</td>
<td>( &lt; 2, 3 &gt; )</td>
<td>1</td>
<td>( \Delta^2_{t_2 R} &lt; 2 &gt; )</td>
</tr>
<tr>
<td>3</td>
<td>( &lt; 1, 2 &gt; )</td>
<td>1</td>
<td>( \Delta^2_{t_3 t_2} &lt; 1 &gt; )</td>
</tr>
</tbody>
</table>

A braid related to the tacnode:

\[
(\xi_{x_1})^\Psi_{\gamma_1} = < 3, 4 > = z_{3 4} \\
\varphi(\delta_1) = Z_{3 4}.
\]

\[
\begin{array}{cccc}
\cdot & 2 & 1 & 4 \\
\end{array}
\]

A braid related to the inner branch point:

\[
(\xi_{x_2})^\Psi_{\gamma_2} = < 2, 3 > \Delta^2 < 3, 4 > = z_{2 3}^{2 4} \\
\varphi(\delta_2) = Z_{2 3} z_{2 3}^{2 4}.
\]

\[
\begin{array}{cccc}
\cdot & 2 & 3 & 4 \\
\end{array}
\]

A braid related to the outer branch point:

\[
(\xi_{x_3})^\Psi_{\gamma_3} = < 1, 2 > \Delta^2_{t_2 R} < 2 > \Delta^2 < 3, 4 > = z_{1 4} \\
\varphi(\delta_3) = Z_{1 4}.
\]
According to the van Kampen Theorem [5], we get the following set of relations for $\pi_1(\mathbb{P}^2 \setminus \mathcal{A}_2)$:

$$(a_3 a_4)^2 = (a_4 a_3)^2,$$

$$a_2 = a_4 a_3 a_4^{-1},$$

$$a_1 = a_4,$$

$$(a_1 a_2)^2 = (a_2 a_1)^2,$$

$$a_3 = a_2 a_1 a_2 a_1^{-1} a_2^{-1},$$

$$a_4 = a_3 a_2 a_1 a_2 a_1^{-1} a_3^{-1},$$

$$a_4 a_3 a_2 a_1 = e \text{ (the projective relation)}.$$

By an easy simplification, we get

$$\pi_1(\mathbb{P}^2 \setminus \mathcal{A}_2) \simeq \langle a_1, a_2 \mid (a_1 a_2)^2 = e \rangle,$$

(2)

which is a big group (replaces Proposition 2.3(ii), page 264 in the paper).

Now, considering the arrangement $\mathcal{A}_3$ (see Figure 5), we can construct the tables of the global braid monodromy. We start with the table related to the singular points on the left side of the typical fiber:

<table>
<thead>
<tr>
<th>$j$</th>
<th>$\xi_{x_j}$</th>
<th>$\epsilon_j$</th>
<th>$\delta_j$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$&lt; 1, 2, 3&gt;$</td>
<td>4</td>
<td>$\Delta^2 &lt; 1, 2, 3&gt;$</td>
</tr>
<tr>
<td>2</td>
<td>$&lt; 3, 4&gt;$</td>
<td>1</td>
<td>$\Delta_{l_2}^1 &lt; 3&gt;$</td>
</tr>
<tr>
<td>3</td>
<td>$&lt; 2, 3&gt;$</td>
<td>1</td>
<td>$\Delta_{l_1}^2 &lt; 2&gt;$</td>
</tr>
<tr>
<td>4</td>
<td>$&lt; 1, 2&gt;$</td>
<td>1</td>
<td>$\Delta_{l_6}^i &lt; 1&gt;$</td>
</tr>
</tbody>
</table>

Figure 5 – The arrangement $\mathcal{A}_3$. 

Revista Matemática Complutense
2009: vol. 22, num. 2, pags. 517–550 524
And we finish with the table related to the singular points on right side of the typical fiber:

<table>
<thead>
<tr>
<th>$j$</th>
<th>$\xi_{x_j}$</th>
<th>$\epsilon_j$</th>
<th>$\delta_j$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$&lt; 4, 5, 6 &gt;$</td>
<td>4</td>
<td>$\Delta^2 &lt; 4, 5, 6 &gt;$</td>
</tr>
<tr>
<td>2</td>
<td>$&lt; 3, 4 &gt;$</td>
<td>1</td>
<td>$\Delta^2_{1,2} &lt; 3 &gt;$</td>
</tr>
<tr>
<td>3</td>
<td>$&lt; 2, 3 &gt;$</td>
<td>1</td>
<td>$\Delta^2_{1,2} &lt; 2 &gt;$</td>
</tr>
<tr>
<td>4</td>
<td>$&lt; 1, 2 &gt;$</td>
<td>1</td>
<td>$\Delta^2_{1,2} &lt; 1 &gt;$</td>
</tr>
</tbody>
</table>

Since we know already how to apply the algorithm of Moishezon-Teicher (using the tables) and how to apply the van Kampen Theorem (see [4] for the algorithm and [5] for the van Kampen Theorem), we can state the resulting presentation of $\pi_1(\mathbb{P}^2\setminus \mathcal{A}_3)$ (after some simple simplifications):

$$\pi_1(\mathbb{P}^2\setminus \mathcal{A}_3) \simeq \langle a_1, a_2, a_3 \mid (a_1a_2a_3)^2 = e \rangle.$$  \hfill (3)

It is easy to see that $\pi_1(\mathbb{P}^2\setminus \mathcal{A}_3)$ is big (replaces Proposition 2.3(iii), page 264 in the paper).

In order to compute the group $\pi_1(\mathbb{P}^2\setminus \mathcal{A}_n)$, we fix first a set of generators $a_1, \ldots, a_{2n}$. Then we apply again the Moishezon-Teicher algorithm for the global monodromy. On each one of the sides of the typical fiber in Figure 1 we have one tacnode and $n$ branch points. Since we have two tacnodes in the arrangement (see propositions above), we have relations (4) and (9). The relations concerning the right branch points are (5)–(8), and the relations concerning the left branch points are (10)–(13):

\[
(a_{n+1}a_{n+2} \cdots a_{2n})^2 = (a_{2n}a_{n+1} \cdots a_{2n-1})^2 = \cdots = (a_{n+2}a_{n+3} \cdots a_{2n}a_{n+1})^2, \quad (4)
\]

\[
a_n = a_{2n}a_{2n-1} \cdots a_{n+2}a_{n+3}a_{n+4} \cdots a_{2n-1}a_{2n}, \quad (5)
\]

\[
a_{n-1} = a_{2n}a_{2n-1} \cdots a_{n+3}a_{n+4}^{-1} \cdots a_{2n-1}^{-1}a_{2n}, \quad (6)
\]

\[
a_{n-2} = a_{2n}a_{2n-1} \cdots a_{n+4}a_{n+3}^{-1} \cdots a_{2n-2}^{-1}a_{2n}, \quad (7)
\]

\[
\cdots, \quad (8)
\]

\[
(a_1a_2 \cdots a_n)^2 = (a_n a_1 \cdots a_{n-1})^2 = \cdots = (a_2a_3 \cdots a_{n})^2, \quad (9)
\]

\[
a_{n+1} = a_n a_{n-1} \cdots a_1 a_n a_1^{-1} \cdots a_{n-1}^{-1} a_n^{-1}, \quad (10)
\]

\[
a_{n+2} = a_{n+1} a_n \cdots a_1 a_{n-1} a_1^{-1} \cdots a_{n-1}^{-1} a_n^{-1}, \quad (11)
\]

\[
a_{n+3} = a_{n+2} a_{n+1} \cdots a_1 a_{n-2} a_1^{-1} \cdots a_{n-2}^{-1} a_n^{-1}, \quad (12)
\]

\[
\cdots, \quad (13)
\]

\[
a_{2n} = a_{2n-1} a_{2n-2} \cdots a_2 a_1 a_2^{-1} \cdots a_{2n-2}^{-1} a_{2n-1}^{-1}, \quad (14)
\]

\[
a_{2n} a_{2n-1} a_{2n-2} \cdots a_2 a_1 = e, \quad (the \ projective \ relation).
\]
We substitute relations (5)–(8) in relations (10)–(13) and get for each one of them one of the following equations:

\[(a_{n+1}a_{n+2} \cdots a_{2n})^{-2} = (a_{2n}a_{n+1} \cdots a_{2n-1})^{-2} = \cdots = (a_{n+2}a_{n+3} \cdots a_{2n}a_{n+1})^{-2} .\]

These equations appear already in (4). Therefore relations (10)–(13) are redundant.

Using relations (5)–(8), one can see that relations (4) and (9) are redundant.

By the same substitution, relation (14) is rewritten as \((a_{n+1}a_{n+2} \cdots a_{2n})^2 = e .\)

Hence, we get the presentation (1).

Corollary 2.4 (page 264 in the paper) is incomplete and can be completed as follows:

**New Corollary 2.4.** The group \(\pi_1(\mathbb{P}^2 \setminus A_n)\) is abelian for \(n = 1\) and big for \(n \geq 2\).

**Proof of New Corollary 2.4.** We computed above the group \(\pi_1(\mathbb{P}^2 \setminus A_2)\). This group is isomorphic to \(\mathbb{Z} \ast \mathbb{Z}_2\), which is known to be big. Since the group \(\pi_1(\mathbb{P}^2 \setminus A_2)\) is a quotient of \(\pi_1(\mathbb{P}^2 \setminus A_n)\) for \(n \geq 2\), the groups \(\pi_1(\mathbb{P}^2 \setminus A_n)\) are big too.

**Remark 1.1.** There is another way to prove that the groups \(\pi_1(\mathbb{P}^2 \setminus A_n)\) are big (for \(n \geq 2\)). These groups are isomorphic to \(\mathbb{Z}^{n-1} \ast \mathbb{Z}_2\), which contain a non-abelian free subgroup.

Theorem 2.5 and Proposition 2.6 (page 264-265 in the paper) are rephrased as one general statement as follows:

**New Theorem 2.5.** The fundamental group \(\pi_1(\mathbb{P}^2 \setminus B_n)\) of \(B_n\) in \(\mathbb{P}^2\) admits the presentation

\[\pi_1(\mathbb{P}^2 \setminus B_n) \simeq \left\langle a_1, a_2, \ldots, a_n \mid (a_1a_2 \cdots a_n)^2 = e \right\rangle,\]

where \(a_1, \ldots, a_n\) are meridians of \(Q_1, \ldots, Q_n\), respectively. Figure 6 replaces Figure 3 from page 265 in the paper.

![Figure 6](image-url)
Proof of the New Theorem 2.5. We are interested in the group \( \pi_1(\mathbb{P}^2\setminus B_n) \). We start with \( B_1 \) (a smooth quadric), and it is easy to see that the group \( \pi_1(\mathbb{P}^2\setminus B_1) \) is \( \mathbb{Z}_2 \) (which is abelian).

The cases \( n = 2, 3 \) have wrong results in the paper (see Proposition 2.6(ii)(iii) in the paper). We prove new results here and conclude the general case \( \pi_1(\mathbb{P}^2\setminus B_n) \). Let us consider the arrangement \( B_2 \), see Figure 7 (replaces Figure 8 from the paper, page 271). Let \( \pi_1 : E \times D \to E \) be the projection to \( E \). Take \( u \in \partial E \), such that \( C_u \) is a typical fiber and let \( K = \{1, 2, 3, 4\} \). For simplicity we denote also the singular points as \( j \) instead of \( A_j \). Let \( \{j\}_{j=1}^2 \) be singular points of \( \pi_1 \) on the left side of the chosen typical fiber as follows: 1 is a branch point of the inner quadric, 2 is a branch point of the outer quadric. Let \( N = \{x(j) = x_j \mid 1 \leq j \leq 2\} \), such that \( N \subset E - \partial E, N \subset E \).

We start with the monodromy table:

<table>
<thead>
<tr>
<th>( j )</th>
<th>( \xi' )</th>
<th>( \epsilon_j )</th>
<th>( \delta_j )</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>( &lt; 2, 3 )</td>
<td>( \Delta^{1}_{L} \subset 2 )</td>
<td>( &lt; 2 )</td>
</tr>
<tr>
<td>2</td>
<td>( &lt; 1, 2 )</td>
<td>( \Delta^{1}_{L} \subset 1 )</td>
<td>( &lt; 1 )</td>
</tr>
</tbody>
</table>

We have the following resulting braids:

A braid related to the inner branch point:

\[
(\xi_{x_1'})^{\psi_{A_1}} = < 2, 3 > = Z_2 3,
\]

\[
\varphi(\delta_1) = Z_2 3,
\]

A braid related to the outer branch point:

\[
(\xi_{x_2'})^{\psi_{A_2}} = < 1, 2 > = \Delta^{1}_{L} \subset 2 \]

\[
\varphi(\delta_2) = Z_1 4 Z_2 3,
\]
Now, in the same manner as explained before, we present the table which relates to the three singular points on the right side of the chosen typical fiber: 1 is a unique tacnode, 2 and 3 are branch points of the quadrics. The related monodromy table is:

\[
\begin{array}{ccc}
 j & \xi_j' & \epsilon_j & \delta_j \\
 1 & 3, 4 > & 8 & \Delta^1 < 3, 4 > \\
 2 & 2, 3 > & 1 & \Delta^1_{I_2} < 2 > \\
 3 & 1, 2 > & 1 & \Delta^1_{I_1 I_2} < 1 > \\
\end{array}
\]

By the algorithm from [4], we compute the braids:

A braid related to the tacnode:

\[
(\xi_1')\Psi_1 = 3, 4 > = z_{3, 4},
\]

\[
\varphi(\delta_1) = z_{3, 4}^8.
\]

\[
\begin{array}{cccc}
 1 & 2 & 3 & 4 \\
\end{array}
\]

A braid related to the inner branch point:

\[
(\xi_2')\Psi_2 = 2, 3 > \Delta^4 < 3, 4 > = z_{2, 3}^{4},
\]

\[
\varphi(\delta_2) = z_{2, 3}^{4}.
\]

\[
\begin{array}{cccc}
 1 & 2 & 3 & 4 \\
\end{array}
\]

A braid related to the outer branch point:

\[
(\xi_3')\Psi_3 = 1, 2 > \Delta^1_{I_2} < 2 > \Delta^4 < 3, 4 > = z_{1, 4}^{3, 4},
\]

\[
\varphi(\delta_3) = z_{1, 4}^{3, 4}.
\]
The relations derived from these braids are as follows:

\[
\begin{align*}
(a_3a_4)^4 &= (a_4a_3)^4, \\
a_2 &= a_4a_3a_4a_3^{-1}a_4^{-1}a_3^{-1}a_4^{-1}, \\
a_1 &= a_4a_3a_4a_3^{-1}a_4^{-1}, \\
a_2 &= a_3, \\
a_1 &= a_3^{-1}a_4a_3, \\
a_4a_3a_2a_1 &= e, \quad \text{(the projective relation)}.
\end{align*}
\]

By an easy simplification, we get that \(\pi_1(P^2\setminus B_2)\) is big (replaces Proposition 2.6(ii), page 265 in the paper): \(\pi_1(P^2\setminus B_2) \cong \langle a_1, a_2 \mid (a_1a_2)^2 = e \rangle \) (as in (2)).

Now, considering the arrangement \(B_3\) (see Figure 8), we can construct the tables of the global braid monodromy. We start with the table related to the singular points on the left side of the typical fiber:

\[
\begin{array}{ccc}
j & \xi_j & \epsilon_j & \delta_j \\
1 & <3,4> & 1 & \Delta_{I_3}^{<3>} \\
2 & <2,3> & 1 & \Delta_{I_2}^{<3>} \\
3 & <1,2> & 1 & \Delta_{I_2}^{<1>}
\end{array}
\]

And we finish with the table related to the singular points on the right side of the typical fiber:

Figure 8 – The arrangement \(B_3\).
Again by the algorithm of Moishezon-Teicher [4] we compute the braids and by the van Kampen Theorem [5] and easy simplifications we get that $\pi_1(\mathbb{P}^2 \setminus \mathcal{B}_3)$ is big (replaces Proposition 2.6(iii), page 265 in the paper):

$$\pi_1(\mathbb{P}^2 \setminus \mathcal{B}_3) \simeq \langle a_1, a_2, a_3 \mid (a_1a_2a_3)^2 = e \rangle, \text{ as in (3)}.$$ 

In order to compute the group $\pi_1(\mathbb{P}^2 \setminus \mathcal{B}_n)$, we fix a set of generators $a_1, \ldots, a_{2n}$. Then we apply again the Moishezon-Teicher algorithm for the global monodromy. On the left side of the typical fiber (see Figure 6) we have $n$ branch points, and on the right side of it we have one tacnode and $n$ branch points. The relations concerning the left points are:

$$a_n = a_{n+1},$$

$$a_{n-1} = a_{n+1}^{-1}a_{n+2}a_{n+1},$$

$$\ldots$$

$$a_1 = a_{n+1}^{-1}a_{n+2}^{-1} \cdots a_{2n-1}^{-1}a_{2n}a_{2n-1} \cdots a_{n+2}a_{n+1},$$

and the relations concerning the right points are:

$$(a_{n+1}a_{n+2} \cdots a_{2n})^4 = (a_{2n}a_{n+1} \cdots a_{2n-1})^4 = \cdots = (a_{n+2}a_{n+3} \cdots a_{2n}a_{n+1})^4,$$  

$$a_n = a_{2n}a_{2n-1} \cdots a_{n+2}a_{n+1}a_{2n} \cdots a_{n+2}a_{n+1}a_{n+2}^{-1} \cdots a_{2n-1}a_{2n}^{-1},$$

$$a_{n-1} = a_{2n}a_{2n-1} \cdots a_{n+2}a_{n+1}a_{2n}a_{2n-1} \cdots a_{n+3}a_{n+2}a_{n+1}^{-1} \cdots a_{2n-1}^{-1}a_{2n}^{-1},$$

$$\ldots$$

$$a_1 = a_{2n}a_{2n-1} \cdots a_{n+2}a_{n+1}a_{2n}^{-1} \cdots a_{2n-1}^{-1}a_{2n}^{-1}.$$ 

The projective relation is:

$$a_{2n}a_{2n-1}a_{2n-2} \cdots a_2a_1 = e.$$ 

We substitute relation (16) in relation (20) and get

$$(a_{n+1}a_{2n}a_{2n-1} \cdots a_{n+2})^2 = (a_{2n}a_{2n-1} \cdots a_{n+1})^2.$$
Substituting relation (17) in relation (21), we get
\[(a_{n+1}a_{2n}a_{2n-1} \cdots a_{n+2})^2 = (a_{n+2}a_{n+1}a_{2n} \cdots a_{n+3})^2.\]

Repeating this procedure, we get for each one of the substitutions (the last step is the substitution of (18) in (22)) one of the following equations:
\[(a_{2n}a_{2n-1} \cdots a_{n+1})^2 = (a_{n+1}a_{2n} \cdots a_{n+2})^2 = \cdots = (a_{2n-1} \cdots a_{n+1}a_{2n})^2.\]

Therefore relation (19) is redundant.

The projective relation is rewritten as
\[(a_{n+1}a_{n+2} \cdots a_{2n})^2 = e\]
(by the same substitutions). Hence we get the presentation (15).

**Corollary 2.7.** The group \(\pi_1(\mathbb{P}^2 \setminus B_n)\) is abelian for \(n = 1\) and big for \(n \geq 2\).

**Proof of Corollary 2.7.** As in New Corollary 2.4.

**Theorem 2.8 and Proposition 2.9.** (page 265-266 in the paper) are rephrased as one general statement as follows:

**New Theorem 2.8.** The fundamental group \(\pi_1(\mathbb{P}^2 \setminus C_n)\) of \(C_n\) in \(\mathbb{P}^2\) admits the presentation
\[
\pi_1(\mathbb{P}^2 \setminus C_n) \simeq \langle a_1, \ldots, a_n \mid [a_i, a_j] = e \quad 2 \leq i, j \leq n, \quad i \neq j \quad (a_1a_k)^2 = (a_ka_1)^2 \quad 2 \leq k \leq n \quad (a_1a_2 \cdots a_n)^2 = e \rangle,
\]
(23)
where \(a_1, \ldots, a_n\) are meridians of \(Q_1, \ldots, Q_n\), respectively. Figure 9 replaces Figure 4 from page 266 in the paper.

**Proof of the New Theorem 2.8.** We are interested in the group \(\pi_1(\mathbb{P}^2 \setminus C_n)\). We start with \(C_1\) (a smooth quadric), and it is easy to see that the group \(\pi_1(\mathbb{P}^2 \setminus C_1)\) is \(\mathbb{Z}_2\) (which is abelian).

The cases \(n = 2, 3\) have wrong results in the paper (see Proposition 2.9(ii)(iii) in the paper). We prove new results here and conclude the general case \(\pi_1(\mathbb{P}^2 \setminus C_n)\), which is stated in the theorem. Let us consider the arrangement \(C_2\). The arrangements \(B_2\) and \(C_2\) look the same, see Figure 7 (replaces Figure 8 from the paper, page 271). Therefore, \(\pi_1(\mathbb{P}^2 \setminus C_2) \simeq (a_1, a_2 \mid (a_1a_2)^2 = e)\) (as in (2)), and it is big (replaces Proposition 2.9(ii), page 266 in the paper).

The arrangement \(C_3\) is depicted in Figure 10. For the arrangement \(C_3\) we first fix local typical fibers. Let \(\pi_1 : E \times D \to E\) be the projection to \(E\). Let \(\{A_j\}_{j=1}^{12}\) be singular points of \(\pi_1\) as follows (the computations for \(C_3\) involve some sophisticated description of the numeration in the fiber, so in order to prevent confusion, we denote...
the singular points as originally stated, i.e. as $A_j$): $A_1, A_2, A_3, A_9, A_{11}, A_{12}$ are branch points, $A_4, A_5, A_6, A_7$ are intersections of the conics, and $A_8, A_{10}$ are tacnodes. Let $K = \{1, 2, 3, 4, 5, 6\}$, such that all of them are real. In order to compute the braid monodromy, we have to move from one typical fiber to another (starting from the very left one, on the left side of $A_{12}$) till we arrive to the typical fiber which is positioned on the right side of the configuration (i.e. on the right side of $A_1$). The points $A_4, A_5, \ldots, A_{12}$ induce already known diffeomorphisms (see [4] and the tables above). Now, when we pass through the point $A_3$ to the next typical fiber on its right side, the points 4 and 5 in $K$ turn to be complex (rotating counterclockwise in $90^\circ$ out of the axis), say $5 + i, 5 - i$ (while letting the point 6 move and replace the previous real position of 4 on the axis). So we have now a local typical fiber on the right side of $A_3$ with $K' = \{1, 2, 3, 4, 5 + i, 5 - i\}$. Passing through the point $A_2$
to the next local typical fiber on its right side, the points 2 and 3 in $K'$ turn to be complex, say $4 + i/2, 4 - i/2$ (while letting the point 4 move and replace the previous real position of 2 on the axis). So we have now a local typical fiber on the right side of $A_2$ with $K'' = \{1, 2, 4 + i/2, 4 - i/2, 5 + i, 5 - i\}$. The last step is to pass through $A_1$ to the final typical fiber. This causes also turning 1 and 2 to complex points, say $3 + i/4, 3 - i/4$. So $K''' = \{3 + i/4, 3 - i/4, 4 + i/2, 4 - i/2, 5 + i, 5 - i\}$. Now, since we are interested in the fundamental group $\pi_1(\mathbb{P}^2 \setminus C_3)$, we let the complex points rotating in a counterclockwise manner back into their right positions in the axis. In this way it is much convenient to deduce through the van Kampen Theorem [5] the relations which relate to $\pi_1(\mathbb{P}^2 \setminus C_3)$ (the resulting braids appear below, involving an axis with six real points). The table of the monodromy is the following:

<table>
<thead>
<tr>
<th>$j$</th>
<th>$\xi_j$</th>
<th>$\epsilon_j$</th>
<th>$\delta_j$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>$P_1$</td>
<td>$\Delta_1^{1/2} l_6 &lt; 1$</td>
<td></td>
</tr>

</tr>
<tr>
<td>12</td>
<td>$&lt; 1, 2 &gt;$</td>
<td>$\Delta_2^{1/2} l_4 &lt; 1$</td>
<td></td>
</tr>
</tbody>
</table>

We note that $P_1$ (resp. $P_2$, $P_4$) is the skeleton connecting the points 1 and 2 (resp. 2 and 3, 4 and 5) when they become complex, see notion and use in [4].

\[
\varphi(\delta_1) = Z_1 z_1 z_1^2 z_3^2 z_3^2 \\

\varphi(\delta_1) = Z_4 z_4 z_5^2 z_5^2 z_1^2 z_4 z_3^2
\[\varphi(\delta_4) = \mathbb{Z}_2^5 \mathbb{Z}_3^2 \mathbb{Z}_5^{-2} \mathbb{Z}_7^{-2}\]

\[\varphi(\delta_5) = \mathbb{Z}_2^4\]

\[\varphi(\delta_6) = \mathbb{Z}_3^2 \mathbb{Z}_5\]

\[\varphi(\delta_7) = \mathbb{Z}_3^2 \mathbb{Z}_5^2 \mathbb{Z}_7^{-2}\]

\[\varphi(\delta_8) = \mathbb{Z}_1^2 \mathbb{Z}_2^4\]

\[\varphi(\delta_9) = \mathbb{Z}_2^2 \mathbb{Z}_3\]

\[\varphi(\delta_{10}) = \mathbb{Z}_5^2 \mathbb{Z}_7^2 \mathbb{Z}_9\]

\[\varphi(\delta_{11}) = \mathbb{Z}_4 \mathbb{Z}_5\]
The group $\pi_1(\mathbb{P}^2, C_3)$ is then generated by $a_1, \ldots, a_6$ and admits the following presentation:

\begin{align}
 a_3a_1a_3^{-1} &= a_5^{-1}a_6a_5, \quad (24) \\
a_1^{-1}a_2a_1 &= a_3^{-1}a_5^{-1}a_6^{-1}a_5a_3a_5^{-1}a_6a_5a_3, \quad (25) \\
[a_3^{-1}a_2a_3, a_4] &= e, \quad (26) \\
[a_3, a_5] &= e, \quad (27)
\end{align}

Substituting (24) in (25), we get $a_4 = a_5$. Relation (26) is rewritten as $[a_2, a_5] = e$ (see relation (27)). So with $a_4 = a_5$ and $[a_2, a_5] = [a_3, a_5] = e$, we can get a simplified
presentation as follows:

\[ a_3a_1a_3^{-1} = a_5^{-1}a_6a_5, \]  
\[ a_1^{-1}a_2a_1 = a_3^{-1}a_5^{-1}a_6^{-1}a_3a_6a_5a_3, \]  
\[ [a_3a_1^{-1}a_2a_1a_3^{-1}, a_5^{-1}a_6^{-1}a_5a_6a_5] = e, \]  
\[ [a_2, a_5] = e, \]  
\[ [a_3, a_5] = e, \]  
\[ [a_1^{-1}a_5a_1, a_3^{-1}a_5^{-1}a_6^{-1}a_3a_5a_3] = e, \]  
\[ (a_1a_2)^4 = (a_2a_1)^4, \]  
\[ a_3 = a_6a_5a_3a_1^{-1}a_5^{-1}a_1a_2a_1a_3^{-1}a_2^{-1}a_3^{-1}a_5a_1a_3^{-1}a_5^{-1}a_6^{-1}, \]  
\[ (a_5a_6)^4 = (a_6a_5)^4, \]  
\[ a_1^{-1}a_5, a_1^{-1}a_4a_1^{-1}a_5a_1 = a_3^{-1}a_5^{-1}a_6^{-1}a_3^{-1}a_6a_5a_6^{-1}a_5^{-1}a_3a_6a_5a_3, \]  
\[ a_1^{-1}a_5a_1 = a_3^{-1}a_5^{-1}a_6^{-1}a_3^{-1}a_6a_5a_6^{-1}a_5^{-1}a_6^{-1}a_3a_6a_5a_3, \]  
\[ a_6a_2^{-1}a_3a_2a_1 = e \]  
(\text{the projective relation}).

Substituting (29) in (31), we get \((a_1a_2)^2 = (a_2a_1)^2\). With (29) and then with (28), we can rewrite relation (32) as \((a_5a_6)^2 = (a_6a_5)^2\). Relation (33) is rewritten as \(a_1^{-1}a_5a_1 = a_3^{-1}a_6a_5a_6^{-1}a_3\), using relation (30). So we have the following relations:

\[ a_3a_1a_3^{-1} = a_5^{-1}a_6a_5, \]  
\[ a_1^{-1}a_2a_1 = a_3^{-1}a_5^{-1}a_6^{-1}a_3a_6a_5a_3, \]  
\[ [a_3a_1^{-1}a_2a_1a_3^{-1}, a_6a_5a_6^{-1}] = e, \]  
\[ [a_2, a_5] = e, \]  
\[ [a_3, a_5] = e, \]  
\[ [a_1^{-1}a_5a_1, a_3^{-1}a_5^{-1}a_6^{-1}a_3a_6a_5a_3] = e, \]  
\[ (a_1a_2)^2 = (a_2a_1)^2, \]  
\[ (a_5a_6)^2 = (a_6a_5)^2, \]  
\[ a_1^{-1}a_5a_1 = a_3^{-1}a_6a_5a_6^{-1}a_3, \]  
\[ a_6a_2^{-1}a_3a_2a_1 = e. \]

Now, substituting (35) in (36) and in (37), we get \([a_3, a_5] = e\) and \([a_2, a_5] = e\) respectively, so (36) and (37) are redundant. At this stage, we replace \(a_1\) with \(a_3^{-1}a_5^{-1}a_6a_6a_5a_3\) (using (34)) in (38) to get \((a_5a_6)^2 = (a_6a_5)^2\), and therefore (38) is redundant. With the same substitution, from (35) we get \(a_2 = a_3\). We replace \(a_2\) with \(a_3\). And these
are the resulting relations:

\[ a_1 = a_3^{-1}a_5^{-1}a_6a_5a_3, \]

\[ [a_3, a_5] = e, \]

\[ (a_1a_3)^2 = (a_3a_1)^2, \]

\[ (a_5a_6)^2 = (a_6a_5)^2, \]

\[ a_6a_5^2a_3^2a_1 = e. \]

Now we continue replacing \( a_1 \) with \( a_3^{-1}a_5^{-1}a_6a_5a_3 \) and we get the final presentation:

\[ \pi_1(P^2 \setminus C_3) \simeq \left\langle a_3, a_5, a_6 \left| \begin{array}{l}
[a_3, a_5] = e \\
(a_3a_6)^2 = (a_6a_3)^2 \\
(a_5a_6)^2 = (a_6a_5)^2 \\
(a_6a_5a_3)^2 = e
\end{array} \right. \right\rangle, \]

where \( a_3, a_5, a_6 \) are meridians of the three quadrics in Figure 10 (replaces Proposition 2.9(iii), page 266 in the paper).

Now let us consider the arrangement \( C_4 \) (Figure 11). Let us fix a base point for

![Figure 11](image_url)

Figure 11 – The arrangement \( C_4 \).

the fundamental group \( \pi_1(P^2 \setminus C_4) \). The setting in this case is similar to the one of \( C_3 \), so we choose the typical fiber on the right side of the configuration, in which the points of the curve are complex. The base point is chosen to be on this fiber.

The braid monodromy table is:
Examples of braid monodromy were computed already above and also in the basic paper [4]. Therefore we skip the long computations in this part and present the resulting braids:

We compute the group $\pi_1(P^2 \setminus \mathcal{C}_4)$ in a similar way as above (using the van Kampen Theorem and a long simplification). The starting set of generators for $\pi_1(P^2 \setminus \mathcal{C}_4)$ is $a_1, \ldots, a_8$. Most of the relations are relatively easy to simplify. The most complicated relations are the ones which are derived from the left branch points (see the braids 18, 20, 22, 23). These relations are translated in fact to relations of the form $(ab)^2 = (ba)^2$. We show now how the branch points relations 18 and 20 are simplified (in the same way as above).
manner one can also simplify the other ones). Relation 18 is the following one (see the 18th braid):

\[ a_1^{-1}a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_2a_3a_2^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1, \]
\[ \cdot a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_2 \cdot a_2^{-1}a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1a_3^{-1}a_5^{-1}a_6a_5a_4a_3, \]
\[ \cdot a_2^{-1}a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1^{-1}a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_1 \]
\[ = a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3 \cdot a_3 \cdot a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3. \]

By relation 2 (see the 2nd braid), we replace \( a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_1^{-1}a_7^{-1}a_8a_7a_5a_3 \) with \( a_1^{-1}a_2a_1 \). So we get:

\[ a_1^{-1}a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1, \]
\[ \cdot a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_2a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1a_3^{-1}a_5^{-1}a_6a_5a_4a_3 \cdot a_2, \]
\[ \cdot a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1^{-1}a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_2^{-1}a_4^{-1}a_5^{-1}a_6^{-1}, \]
\[ \cdot a_5a_3a_1^{-1}a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_1 \]
\[ = a_1^{-1}a_2a_1. \]

Now we use the commutation relation 10 ([a_3a_2a_3^{-1}, a_4] = e) to simplify the relation to the following form:

\[ a_5^{-1}a_6^{-1}a_5a_3a_1a_3^{-1}a_5^{-1}a_6a_5a_3a_2a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1a_3^{-1}a_5^{-1}a_6a_5a_3a_2a_3^{-1}, \]
\[ \cdot a_5^{-1}a_3^{-1}a_3^{-1}a_5^{-1}a_6a_5a_3a_2a_3^{-1}a_4^{-1}a_5^{-1}a_6^{-1}a_5a_3a_1a_3^{-1}a_5^{-1}a_6a_5a_3a_2a_3^{-1}, \]
\[ \cdot a_5a_3a_1^{-1}a_3^{-1}a_5^{-1}a_6a_5a_4a_3a_1 \]
\[ = a_3^{-1}a_2a_3^{-1}. \]

By the commutation relation 11 ([a_3a_2a_3^{-1}, a_5^{-1}a_6a_3] = e), we simplify the relation to the following form:

\[ a_1a_2a_1a_2a_4^{-1}a_2^{-1}a_1^{-1}a_2, \]

which is \( (a_1a_2)^2 = (a_2a_1)^2 \).

Now let us see how relation 20 can be simplified. Relation 20 is the following one (see the 20th braid):

\[ a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_3^{-1}a_5^{-1}a_7^{-1}a_8a_7a_5a_3 \cdot a_7, \]
\[ \cdot a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_7^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_7^{-1} \]
\[ = a_1^{-1}a_3^{-1}a_5^{-1} \cdot a_6 \cdot a_5a_3a_1. \]

By relation 4, we replace \( a_1^{-1}a_3^{-1}a_5^{-1}a_6a_5a_3a_1 \) with \( a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_7^{-1}a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_7^{-1} \). So we get:

\[ a_7a_3^{-1}a_5^{-1}a_7^{-1}a_8a_7a_5a_3a_7^{-1}a_5^{-1}a_7^{-1}a_8a_7a_5a_3 \cdot a_7, \]
\[ \cdot a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_7^{-1}a_3^{-1}a_5^{-1}a_7^{-1}a_8^{-1}a_7a_5a_3a_7^{-1} \]
\[ = a_7. \]
And now we use relations 6 and 9 ([a_5, a_7] = e and [a_3, a_7] = e) to simplify it to the following form:

\[ a_8 a_7 a_8 a_7^{-1} a_7^{-1} a_8^{-1} = a_7, \]

which is \((a_7 a_8)^2 = (a_8 a_7)^2\).

Now, when we know how to deal with the relations, we add the projective relation \(a_8 \cdots a_1 = e\) to the presentation, and after some easy simplification we are able to get:

\[
\pi_1(\mathbb{P}^2 \setminus \mathcal{C}_4) \simeq \left\langle a_1, a_2, a_3, a_4 \left| \begin{array}{c}
[a_2, a_3] = [a_2, a_4] = [a_3, a_4] = e \\
(a_1 a_i)^2 = (a_i a_1)^2, i = 2, 3, 4 \\
(a_4 a_3 a_2 a_1)^2 = e
\end{array} \right. \right\rangle.
\]

As for the general case \(\pi_1(\mathbb{P}^2 \setminus \mathcal{C}_n)\) (see Figure 9), the argumentation as presented in the arrangements \(\mathcal{C}_2, \mathcal{C}_3\) and \(\mathcal{C}_4\) actually applies to the general case as well. The initial set of generators for \(\pi_1(\mathbb{P}^2 \setminus \mathcal{C}_n)\) is \(a_1, \ldots, a_{2n}\). We present now the resulting braids and the induced relations:

- There are \(n\) branch points on the right side of the configuration. They contribute the following braids and relations:

\[
a_{2n-1} a_{2n-3} \cdots a_7 a_5 a_3 a_1 a_3^{-1} a_5^{-1} a_7^{-1} \cdots a_{2n-3} a_{2n-1}^{-1} = a_{2n},
\]

\[
a_1^{-1} a_2 a_1 = a_3^{-1} a_5^{-1} a_7^{-1} \cdots a_{2n-3} a_{2n-1}^{-1} a_{2n-1} a_{2n-3}^{-1} a_{2n-3} a_{2n-1}^{-1} \cdots a_7 a_5 a_3 a_1^{-1} a_7^{-1} \cdots a_{2n-3} a_{2n-1}^{-1} a_{2n-1} a_{2n-3} \cdots a_7 a_5 a_3,
\]

\[
a_3 a_1^{-1} a_3^{-1} a_4 a_3 a_1 a_3^{-1} = a_5^{-1} a_7^{-1} a_{2n-1}^{-1} a_{2n} a_{2n-1}^{-1} \cdots a_7 a_5^{-1} a_{2n-1}^{-1} a_{2n} a_{2n-1} \cdots a_7 a_5,
\]
and in an inductive way, we get more braids and relations for each two consecutive points, where the last braid is

\[
a_{2n-3} \cdots a_3 a_2^{-1} a_1 a_3^{-1} a_5^{-1} \cdots a_{2n-3} a_{2n-2} a_{2n-3} \cdots a_3 a_2 a_1 a_3^{-1} a_5^{-1} \cdots a_{2n-3}^{-1} = a_{2n-1}^{-1} a_{2n-1} a_{2n}^{-1} a_{2n} a_{2n-1}^{-1}.
\]

- The intersection points of the conics contribute three types of braids and relations:

\[
[a_i, a_j] = e,
\]

for \(i, j\) odd and \(3 \leq i < j \leq 2n - 1\).

\[
[a_{m-1} a_{m-2} \cdots a_{k+1} a_k a_{k+1}^{-1} \cdots a_{m-2} a_{m-1}^{-1} a_m] = e,
\]

for \(k, m\) even and \(2 \leq k < m \leq 2n - 2\).

\[
[a_{i-1} \cdots a_3 a_2^{-1} a_3^{-1} \cdots a_{i-1} a_i a_{i-1} \cdots a_3 a_2 a_3^{-1} \cdots a_{i-1} a_{i+1} a_{i+3}^{-1} \cdots a_{j-2} a_j a_{j+2} a_{j+2}^{-1} \cdots a_{2n-3} a_{2n-1} a_{2n-1}^{-1} a_{2n-3} a_{2n-1}^{-1} a_{2n-3} \cdots a_{j+2} a_j a_{j-2} \cdots a_{i+3} a_{i+1}] = e,
\]

for \(i\) even, \(j\) odd and \(2 \leq i \leq 2n - 2, 3 \leq j \leq 2n - 1\).
The tacnodes contribute the following braids and relations for $i$ even and $2 \leq i \leq 2n - 4$:

\[
\begin{align*}
(\alpha_1 \cdot \alpha_3^{-1} \cdot \alpha_5^{-1} \cdots \alpha_{i-1}^{-1} \cdot \alpha_i^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-2} \cdot a_{2n-3}^{-1} \cdots a_{i+2} \cdot a_{i+1} \cdot a_i^{-1} \cdot a_{i+2}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots \\
(\alpha_3^{-1} \cdot \alpha_5^{-1} \cdots \alpha_{i-1}^{-1} \cdot \alpha_i^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-2} \cdot a_{2n-3}^{-1} \cdots a_{i+2} \cdot a_{i+1} \cdot a_i^{-1} \cdot a_{i+2}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots
\end{align*}
\]

\[
= (\alpha_3^{-1} \cdot \alpha_5^{-1} \cdots \alpha_{i-1}^{-1} \cdot \alpha_i^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-2} \cdot a_{2n-3}^{-1} \cdots a_{i+2} \cdot a_{i+1} \cdot a_i^{-1} \cdot a_{i+2}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots
\]

and also

\[
\begin{align*}
(\alpha_2 \cdot \alpha_{2n-1} \cdot \alpha_{2n-3} \cdots \alpha_5 \cdot \alpha_3 \cdot \alpha_{2n-1} \cdot \alpha_3^{-1} \cdot a_5^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-3}^{-1} \cdots a_{2n-3}^{-1} \cdot a_{2n-1}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots \\
(\alpha_2 \cdot \alpha_{2n-1} \cdot \alpha_{2n-3} \cdots \alpha_5 \cdot \alpha_3 \cdot \alpha_{2n-1} \cdot \alpha_3^{-1} \cdot a_5^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-3}^{-1} \cdots a_{2n-3}^{-1} \cdot a_{2n-1}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots
\end{align*}
\]

\[
= (\alpha_2 \cdot \alpha_{2n-1} \cdot \alpha_{2n-3} \cdots \alpha_5 \cdot \alpha_3 \cdot \alpha_{2n-1} \cdot \alpha_3^{-1} \cdot a_5^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-3}^{-1} \cdots a_{2n-3}^{-1} \cdot a_{2n-1}^{-1} \cdots \cdot a_{2n}^{-1})^4.
\]

The branch points on the left side of Figure 9 contribute braids which are being thicker and thicker as long as we proceed to a branch point far away from the typical fiber. The following braid is related to the first branch point (from the right) in this set of branch points (the dotted lines mean: the path is above odd-numbered points and below even-numbered points):

\[
\begin{align*}
(\alpha_2 \cdot \alpha_{2n-1} \cdot \alpha_{2n-3} \cdots \alpha_5 \cdot \alpha_3 \cdot \alpha_{2n-1} \cdot \alpha_3^{-1} \cdot a_5^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-3}^{-1} \cdots a_{2n-3}^{-1} \cdot a_{2n-1}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots \\
(\alpha_2 \cdot \alpha_{2n-1} \cdot \alpha_{2n-3} \cdots \alpha_5 \cdot \alpha_3 \cdot \alpha_{2n-1} \cdot \alpha_3^{-1} \cdot a_5^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-3}^{-1} \cdots a_{2n-3}^{-1} \cdot a_{2n-1}^{-1} \cdots) \\
\cdots \cdots \cdots \\
\cdots \cdots \cdots
\end{align*}
\]

\[
= (\alpha_2 \cdot \alpha_{2n-1} \cdot \alpha_{2n-3} \cdots \alpha_5 \cdot \alpha_3 \cdot \alpha_{2n-1} \cdot \alpha_3^{-1} \cdot a_5^{-1} \cdots \alpha_{2n-3}^{-1} \cdot a_{2n-3}^{-1} \cdots a_{2n-3}^{-1} \cdot a_{2n-1}^{-1} \cdots \cdot a_{2n}^{-1})^4.
\]

The next braid is related to the second branch point (from the right) in this set of branch points:
and so on.

Here, as in the case of \( C_4 \), the relations are relatively easy to simplify, but the ones from the latter set are long and complicated. We show how to simplify the first relation in the latter set (in a similar way we simplify the other ones in this set). This relation is (Figure 12):

\[
\begin{align*}
& a_3^{-1}a_5^{-1}a_7^{-1} \cdots a_{2n-3}^{-1}a_{2n-1}^{-1}a_{2n-2}^{-1}a_{2n-3} \cdots a_7a_5 \cdot a_3 \cdot a_5^{-1}a_7^{-1} \cdots \\
& \cdots a_{2n-3}^{-1}a_{2n-1}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3 \\
& = a_1^{-1}a_3^{-1}a_4^{-1}a_5^{-1} \cdots a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
\end{align*}
\]

By the first set of branch points we can substitute \( a_1^{-1}a_2a_1 \) instead of

\[
\begin{align*}
& a_3^{-1}a_5^{-1}a_7^{-1} \cdots a_{2n-3}^{-1}a_{2n-1}^{-1}a_{2n-2}^{-1}a_{2n-3} \cdots a_7a_5 \cdot a_3 \cdot a_5^{-1}a_7^{-1} \cdots \\
& \cdots a_{2n-3}^{-1}a_{2n-1}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3 \\
& = a_1^{-1}a_3^{-1}a_4^{-1}a_5^{-1} \cdots a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
& \cdots a_{2n-5}^{-1}a_{2n-3}^{-1}a_{2n-2}^{-1}a_{2n-3}^{-1}a_{2n-5} \cdots a_7a_5a_3a_1a_3^{-1}a_5^{-1}a_7^{-1}a_9^{-1} \cdots \\
\end{align*}
\]

And by moving \( a_3^{-1}a_4^{-1}a_5^{-1} \cdots a_{2n-3}^{-1}a_{2n-2}^{-1} \) and \( a_{2n-2}^{-1}a_{2n-3} \cdots a_5a_4a_3 \) to the other
At this stage, the element
\[a_{m-1}a_{m-2} \cdots a_{k+1}a_k a_{k+1}^{-1} \cdots a_{m-2}a_{m-1}^{-1} a_m] = e,\]
for \(k, m\) even and \(2 \leq k < m \leq 2n - 2\), can be written as
\[a_{2n-3} \cdots a_{5a_4a_3a_2a_1^{-1} a_5^{-1} \cdots a_{2n-3}, a_{2n-2}] = e,\]
for \(k = 2\) and \(m = 2n - 2\). This relation enables us to omit the element \(a_{2n-2}\):
\[a_{2n-3} \cdots a_{5a_4a_3a_2a_1^{-1} a_5^{-1} \cdots a_{2n-3} a_{2n-2}] = e,\]
At this stage, the element \(a_{2n-3}\) can be omitted too, so we have now:
\[a_{2n-4}(a_{2n-5} \cdots a_{5a_4a_3a_2a_1^{-1} a_5^{-1} \cdots a_{2n-5})a_{2n-4}] = e,\]
We use again the above commutation relation

\[ [a_{2n-5} \cdots a_5 a_3 a_2 a_1^{-1} a_4^{-1} a_5 \cdots a_{2n-5}^{-1}, a_{2n-4}] = e, \]

for \( k = 2 \) and \( m = 2n - 4 \), to omit \( a_{2n-4} \). Omitting this element, enables us to omit also \( a_{2n-5} \):

\[
\begin{align*}
  a_{2n-6} \cdots a_5 a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_5^{-1} \cdots a_{2n-6}^{-1} \\
  = a_{2n-7} \cdots a_5 a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_5^{-1} \cdots a_{2n-7}^{-1} \\
  \cdots a_{2n-2}^{-1} (a_{2n-6} \cdots a_5 a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_5^{-1} \cdots a_{2n-6}^{-1}) a_{2n-7} \cdots \\
  \cdots a_2^{-1} (a_{2n-6} \cdots a_5 a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_5^{-1} \cdots a_{2n-6}^{-1}) a_{2n-7} \\
  \cdots a_2^{-1} (a_{2n-6} \cdots a_5 a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_5^{-1} \cdots a_{2n-6}^{-1}) a_{2n-7} \\
  \cdots a_2^{-1} (a_{2n-6} \cdots a_5 a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_5^{-1} \cdots a_{2n-6}^{-1}) a_{2n-7}.
\end{align*}
\]

We continue in the same way to omit elements till we get the following form:

\[
a_{4} a_3 a_2 a_1^{-1} a_4^{-1} = a_3 a_1 a_3^{-1} a_4 a_3 a_2 a_1^{-1} a_4^{-1} a_3 a_1^{-1} a_3^{-1} a_4.
\]

And in the last time we use the same commutation relation in the form of

\[
[a_3 a_2 a_1^{-1}, a_4] = e,
\]

for \( k = 2, m = 4 \), to get

\[
a_2 = a_1 a_2 a_1 a_2 a_1^{-1} a_2^{-1} a_1^{-1},
\]

which is \((a_1 a_2)^2 = (a_2 a_1)^2\).

After simplifying the latter set of relations and the other sets of relations (which are easy to simplify), we add the projective relation \( a_{2n} a_{2n-1} \cdots a_2 a_1 = e \). This enables us to continue the simplification and get the presentation for \( \pi_1(\mathbb{P}^2 \setminus C_n) \), as it appears in (23) - this presentation replaces the one from the paper, Theorem 2.8, page 265.

We add a corollary which does not appear in the original paper, but holds.

**Corollary 1.2.** The group \( \pi_1(\mathbb{P}^2 \setminus C_n) \) is abelian for \( n = 1 \) and big for \( n \geq 2 \).

**Proof.** If we forget the indices \( i \geq 3 \) in (23), we get \( \pi_1(\mathbb{P}^2 \setminus A_2) \) which is isomorphic to \( \mathbb{Z} \ast \mathbb{Z}_2 \), and from this point, it clear that \( \pi_1(\mathbb{P}^2 \setminus C_n) \) is big (see the proof of New Corollary 2.4).
2. Wrong stated results in the paper

Proposition 4.1 (page 270 in the paper) and its Corollary 4.2 (page 271 in the paper) need to be rephrased: as the proofs in the paper show, the monodromy is a quadruple fulltwist, not a double fulltwist as erroneously stated.

**New Proposition 4.1.** Let $O$ be a unique tacnode between $n$ quadrics. Then the local monodromy around $O$ is a quadruple fulltwist on the disk.

**Acknowledgement.** We wish to thank an anonymous reader for pointing out some inaccuracies.
