## 8. Validating the alliance Agrostio-Stipion giganteae

The alliance *Agrostio-Stipion giganteae* has remained invalid till now, because the various conditions for valid publication have not been simultaneously fulfilled across a relatively long number of works concerning the syntaxon and their subordinate associations.

This alliance was formerly proposed by Rivas Goday (Anales Inst. Bot. Cavanilles 15 [1957]: 640-641. 1958<sup>1</sup>; *sub 'Agrostido-Stipion giganteae'*) as provisional and therefore invalidly (CPN, Art. 3b). Furthermore, its diagnosis does not contain a valid name of subordinate association. Provisionality will be removed later by Rivas Goday & Rivas-Martínez (Estudio y clasificación de los pastizales españoles, Publ. Minist. Agric. 127: 27, 253. Madrid, 1963), but no valid name of subordinate association within the alliance is furnished (Art. 8).

In 1964, Rivas Goday (Vegetación y flórula de la cuenca extremeña del Guadiana: 361-364. Badajoz) inserts in the alliance several communities without accurate denomination, that had been already included in the provisional description at 1958. Moreover, some of these relevés are doubly assigned through this book: to this alliance as communities (*op. cit.*: 361-364. 1964) and to the provisional alliance *Gymnogrammo-Scrophularion* (subordinated by the author to the class *Thlaspietea rotundifolii*) under the name 'as. *Scrophularia et Arisarum vulgare clusii* subas. *Scrophularia schousboei*' (*op. cit.*: 117-119. 1964).

Similar considerations must be applied to the paper of Rivas-Martínez (Anales Inst. Bot. Cavanilles 32(2): 1522. 1975), that refers two associations in the alliance (the author citation of which is attributed to 'Rivas Goday (1957) 1964'): '*Arrhenathero-Stipetum giganteae* Rivas-Martínez ined.' and '*Centaureo-Stipetum lagascae* (Rivas Goday 1957) Rivas-Martínez *nom. nov.*'. The first is a *nomen nudum*, and the second must be considered the same, since no such a name appears in the paper of Rivas Goday (*op. cit.*, 1958) and no unambiguous reference to some of the concerned relevés of Rivas Goday (*op. cit.*, 1958) is apportioned. Art. 6 of CPN cannot be applied in this case, because it is not a validation of an older invalid name. In fact, the paper of Rivas Goday is not directly referred in bibliography (Rivas-Martínez, *op. cit.*: 1554-1555. 1975). *Stipa lagascae* appears in several relevés of those inserted by Rivas Goday (*op. cit.*, 1958) among the text describing the alliance: 'Comunidad provis. *Stipa lagascae et Stipa gigantea*' with three 'subcommunities' (pages 641-645) and a community not named (pages 645-646, 2 relevés). It seems that requirements of Art. 2b & 7 of the CPN are not satisfied in the paper of Rivas-Martínez (*op. cit.*, 1975).

Latter authors have considered the alliance to be validated by 'Rivas Goday (1957) 1964'. Thus, this is the author citation adopted by Rivas-Martínez (Colloq. Phytosociol. 6: 58. 1978), Peinado & Martínez Parras (El paisaje vegetal de Castilla-La Mancha: 221. 1985), Rivas-Martínez, Fernández-González & Sánchez-Mata (Opusc. Bot. Pharm. Complutensis 2: 57. 1986), Rivas-Martínez & Cantó (Lazaroa 7: 254. 1987) and so on. In the same wrong way, the association *Centaureo-Stipetum lagascae* has been considered to be validated by 'Rivas-Martínez 1975' in several papers.

The first valid publication of an association belonging to this alliance will be that of *Melico magnoliif.-Stipetum giganteae* Rivas-Martínez ex Peinado & Martínez Parras 1985 [*op. cit.*: 89, 225]. However, simultaneous validation of the alliance cannot be accepted in this book, since the character and/or differential species are

<sup>1</sup> For effective publication dates of this journal see Izco, Anales Inst. Bot. Cavanilles 32(1): 287-326. 1975.

not explicitly indicated (Art. 8, 2<sup>nd</sup> paragraph), neither for the alliance —that the authors do not intend to validate— nor for the association —whose nomenclatural type is a quoted relevé published by Rivas Goday (*op. cit.*: 648. 1958) without indication of character and/or differential species—. Our posterior diagnosis of the alliance (Rivas-Martínez, Fernández-González & Sánchez-Mata, *op. cit.*: 57-59. 1986) would be sufficient at these points, but since two valid associations are included in it (*Arrhenathero-Stipetum giganteae* Rivas-Martínez *in* Rivas-Martínez, F. Fernández-González & Sánchez-Mata 1986 and *Melico-Stipetum giganteae* Rivas-Martínez *ex* Peinado & Martínez Parras 1985) and no nomenclatural type is designated, the name of the alliance remains invalid (Art. 5). Rivas-Martínez & Cantó (*op. cit.*: 254. 1987) do not refer association names under the alliance (Art. 2b, 8); in fact, this paper had been written earlier than the quoted one of Rivas-Martínez, Fernández-González & Sánchez-Mata, though it would be published later.

Fortunately, no another name seems to be involucrated in the history of these syntaxa, so the validation of *Agrostio-Stipion giganteae* and *Centaureo-Stipetum lagascae* that we next propose will not bring about undesirable nomenclatural changes, excepting those derivated from priority dates.

All. *Agrostio castellanae-Stipion giganteae* Rivas Goday *ex* Rivas-Martínez & F. Fernández-González, *all. nova*

Nomenclatural type: *Arrhenathero baetici-Stipetum giganteae* Rivas-Martínez, F. Fernández-González & Sánchez-Mata 1986 [Opusc. Bot. Pharm. Complutensis 2: 58-59, tab. 2] (holotype).

Syn.: *Agrostio* [*Agrostido*] - *Stipion giganteae* Rivas Goday 1958 [*op. cit.*: 640-641. 1958] *nom. prov. inval.* (Art. 3b), Rivas Goday & Rivas-Martínez 1963 [*l.c.*] *nom. inval.* (Art. 2b, 8), Rivas-Martínez 1975 [*op. cit.*: 1522. 1975] *nom. inval.* (Art. 2b, 8), Rivas-Martínez, Fernández-González & Sánchez-Mata 1986 [*l.c.*] *nom. inval.* (Art. 5), Rivas-Martínez & Cantó 1987 [*l.c.*] *nom. inval.* (Art. 2b, 8).

Description: Tall dry (xerophytic) pastures dominated by *Stipa gigantea* ("berceales", "berciales") or *Stipa lagascae* ("lastonares"), that develop over deep, humic cambisols in meso- and supramediterranean bioclimatic belts of the Mediterranean-iberoatlantic superprovince.

Character species: *Arrhenatherum elatius* subsp. *baeticum*, *Armeria lacaitae*, *Stipa lagascae* subsp. *lagascae*, *Stipa gigantea*.

Associations included:

1. *Arrhenathero baetici-Stipetum giganteae* Rivas-Martínez, F. Fernández-González & Sánchez-Mata 1986
2. *Melico magnolii-Stipetum giganteae* Rivas-Martínez *ex* Peinado & Martínez Parras 1985 [*l.c.*]
3. *Centaureo ornatae-Stipetum lagascae ass. nova*

Nomenclatural type: Rivas Goday, Anales Inst. Bot. Cavanilles 15: 645-646, rel. b. 1958 (holotype). Transcription of the relevé type (original Rivas Goday's identifications marked in brackets if corrected).- Madrid: Galapagar, 10 m. *Stipa lagascae* 3.4, *Centaurea ornata* 1.1, *C. castellana* Boiss. & Reuter 1.1, *Dactylis glomerata* 1.1, *Agrostis castellana* 1.2, *Melica*

*ciliata* subsp. *magnoliae* (Godron & Grenier) K. Richter 1.1, *Carex chaetophylla* Steudel 1.2, *Carlina hispanica* Lam. ## 9. *Hieracietum carpetani e Hieracion carpetani versus Saxifragetum willkommianaee y Saxifragion willkommianaee*

En su obra "Datos sobre la Flora y Fitosociología de la provincia de Madrid" (Bol. Real Soc. Espa. Hist. Nat. 38: 9-20. 1941), González-Albo describe la asociación *Hieracietum carpetani*, que fundamenta en tres inventarios (*op. cit.*: 16, Cuadro 2) procedentes de Siete Picos (Sierra de Guadarrama). Según su autor, esta asociación "caracteriza las partes rupestres de la Sierra de Guadarrama, de naturaleza silícea en su zona subalpina y superior, es decir, en parte de máxima altitud" (*op. cit.*: 17). Según se desprende de la tabla, la asociación se caracteriza florísticamente por la presencia de *Hieracium carpetanum* Willk. in Willk. & Lange, *Saxifraga willkommiana* (*S. pentadactylis* var. *willkommiana*), *Asplenium septentrionale*, *Cryptogramma crispa* (*Allosorus crispus*), *Senecio pyrenaicus* subsp. *carpetanus* (Willk.) Rivas-Martínez (*S. p.* var. *caespitosus*), *Veronica fruticans* subsp. *cantabrica* Lainz (*V. fruticulosa* var. *pilosa*) e *Hieracium amplexicaule* entre otras plantas (indicamos los nombres actualizados de los taxones y entre paréntesis las determinaciones con que aparecen citados en los trabajos originales). Además de la subasociación típica (invent. 1-2), describe una subasociación con *Murbeckiella boryi* (*Phryne boryi*) que, según el autor, "difiere en la mayor humedad, así como protección de algunos vientos" (*op. cit.*: 16-17, invent. 3).

Por otra parte, en su "Estudio de la vegetación y flora de las Sierras de Guadarrama y Gredos" (Anales Inst. Bot. Cavanilles 21(1): 42-48. 1963), Rivas-Martínez propone la nueva asociación *Saxifragetum willkommianaee*, basada en una tabla de 17 inventarios de la Sierra de Guadarrama y de la cual considera sinónimos
