Appendix S2. Pool characteristics obtained from a modified TWINSPAN classification.

The plant communities' names for pool and the number of vegetation plots were indicated. The name of the alliance or community type to which a pool corresponds is named, as well as the number of plots assigned to the pool. Diagnostic, constant, and dominant species are presented for each pool. The numbers reported for diagnostic species are fidelity values (numbers for diagnostic species correspond to values of the phi coefficient of association between species and plots assigned to the alliance, multiplied by 100). Numbers for constant species are percentage frequencies, and numbers for dominant species are percentage frequencies of occurrences with a cover higher than 10. These data were obtained using JUICE software. A distribution map of the vegetation plots by the pool is also provided, colours indicate the biogeographic area recognized by Rivas-Martínez *et al.* (2004): red for supramediterranean pools; green for oromediterranean pools.

Appendix S5. Diagnostic, constant and dominant species for plant communities classified by the expert system. The lists of alliances, order and classes were obtained after merging plant communities belonging to the same syntaxon. The numbers reported for diagnostic species are fidelity values, those for constant species are percentage frequencies, and those for dominant species are percentage frequencies of occurrences with coverage greater than 10.

Supramediterranean chamephytic scrub growing on shallow crystalline soils dominated by *Helichrysum italicum* subsp. *italicum* and *Genista salzmannii* var. *salzmannii* [A]. The repeated passage of fires has favoured the development of *Genista salzmannii* var. *salzmannii* [B].

Figure S3. *Juniperetum nanae*. © Delbos Pauline (2015) – Asco valley (Cinto massif - Corsica). Oromediterranean low-shrub consisting mainly of spiny nanophanerophytes and chamephytes dominated by *Juniperus communis* subsp. *alpina*. When the soil is deeper, *Pinus nigra* subsp. *laricio* is more prevalent [A]. On the wettest areas, *Betula pendula* forests replace *Juniperetum nanae* [B].

Figure S4. *Thymo herbae-baronae* – *Genistetum lobelioidis*. © Delbosc Pauline (2014) – Cuscione (Incudine massif - Corsica). This vegetation constitutes the most degraded stage of oromediterranean vegetations and develops on eroded and stony soils. This low-shrub is dominated by *Genista salzmannii* var. *lobelioides* and *Thymus herba-barona*.

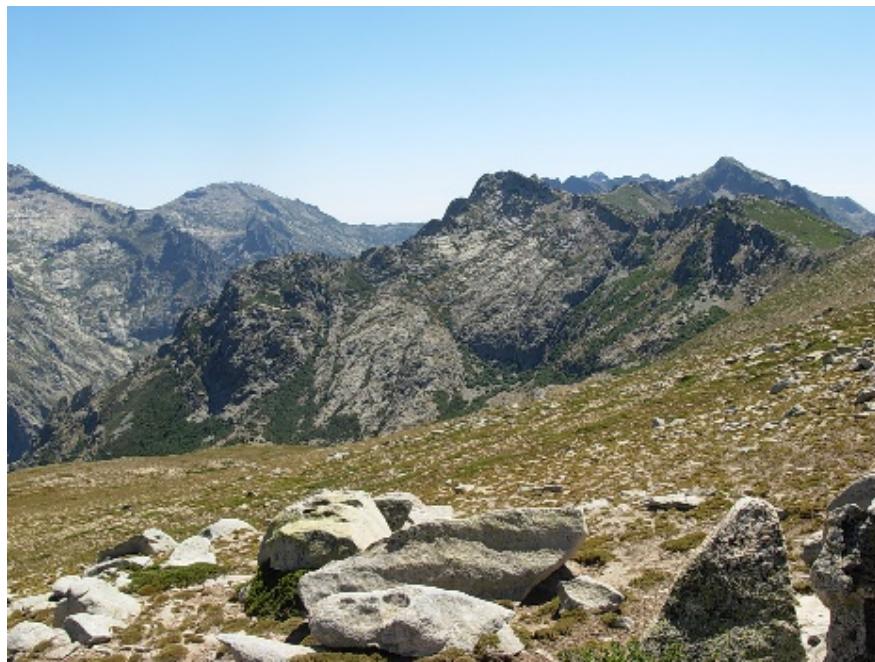

Figure S5. *Paronychio polygonifoliae*-*Genistetum lobelioides*. © Delbosc Pauline (2014) – Asco valley (Cinto massif - Corsica). This photography represents oromediterranean low-shrub growing on siliceous substrates dominated by *Genista salzmannii* var. *lobelioides* and *Juniperus communis* subsp. *alpina*.
